

Cups/Tea4Cups

By Eduardo Aguilera

What's CUPS used for?

- CUPS stands for Common UNIX printing System
- CUPS is a printing system that allows computer work as a print server.
- CUPS is a host that allows print jobs to be processed through the backend
- CUPS main components consist of a filter system that converts the print data using a print spooler and scheduler

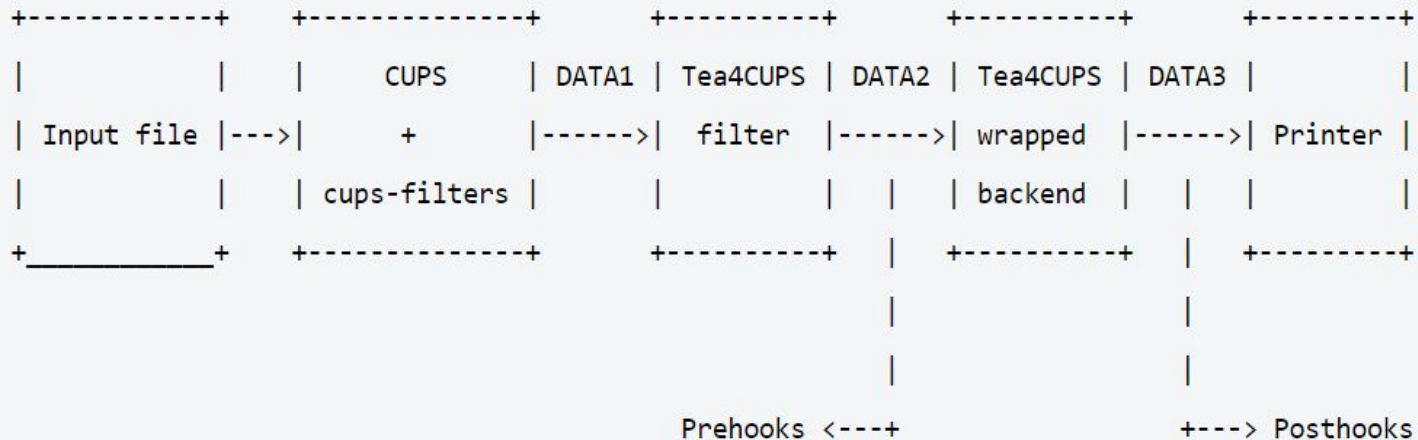

What's Tea4cups?

- Tea4Cups is a backend of CUPS that can be modified to capture print jobs and saved them to a allocated directory
- Tea4Cups can be used to save print jobs as PDF files
- Tea4Cups can be used to monitor print jobs uses. For example how many papers has a user printed that day.
- There are three ways Tea4Cups backend can be modified which are
 - **Filters**
 - **PreHooks**
 - **Posthooks**

This is how Tea4Cups backend works

DATA1=DATA2 without a Tea4CUPS filter.

README file of how to install and configure TEA4CUPS and merge it with the backend of CUPS

root@cups2:~/tea4cups-3.12_official

Installation :

- 0 - Download Tea4CUPS from :
<http://www.pykota.com/software/tea4cups>
and extract it :

```
$ tar -xzf tea4cups-x.yy.tar.gz
```

where x.yy is Tea4CUPS' version number.
- 1 - Copy the 'tea4cups' command into CUPS' backend directory, for example :

```
$ cp tea4cups /usr/lib/cups/backend
```

If you use CUPS v1.2 or higher you must do this as well :

```
$ chown root.root /usr/lib/cups/backend/tea4cups  
$ chmod 700 /usr/lib/cups/backend/tea4cups
```
- 2 - Restart CUPS in order for this new backend to be detected.
NB : For this to work you need CUPS 1.1.15 or higher.
You can use Tea4CUPS with older versions if you want, but without autodetection.
- 3 - Either from CUPS' web interface, add new printers with 'Tea4CUPS managed' in front of the device's name.

Or by directly modifying CUPS' printers.conf file, or with the lpadmin command line tool, just prepend each DeviceURI value with 'tea4cups://'. If you modified printers.conf directly instead of using lpadmin then don't forget to restart CUPS.
(Use this last method if autodetection doesn't work because the version of CUPS you use is too old)
- 4 - Copy tea4cups.conf into CUPS' configuration directory (where cupsd.conf resides) :

root@cups2:~/tea4cups-3.12_official

directly instead of using lpadmin then don't forget to restart CUPS.
(Use this last method if autodetection doesn't work because the version of CUPS you use is too old)

- 4 - Copy tea4cups.conf into CUPS' configuration directory (where cupsd.conf resides) :

```
$ cp tea4cups.conf /etc/cups/
```
- 5 - Modify tea4cups.conf to suit your needs. Several examples are included.
- 6 - There's no 6 !

Troubleshooting :

- 1 - Set "LogLevel debug2" and "MaxLogSize 0" in CUPS' cupsd.conf
- 2 - Restart CUPS.
- 3 - Set "debug: yes" in the [global] section of tea4cups.conf
- 4 - Print something on a print queue managed by Tea4CUPS.
- 5 - Look at CUPS' error_log file for diagnostic and error messages.

CUPS (Common UNIX(r) Printing System) is trademark property of Easy Software Products.

You can download CUPS from :

<http://www.cups.org>

Please e-mail bugs to : alet@librelogiciel.com (Jerome Alet)

tea4cups.conf

```
[LP351]
#posthook_test : lp -dCups-PDF $TEADATAFILE

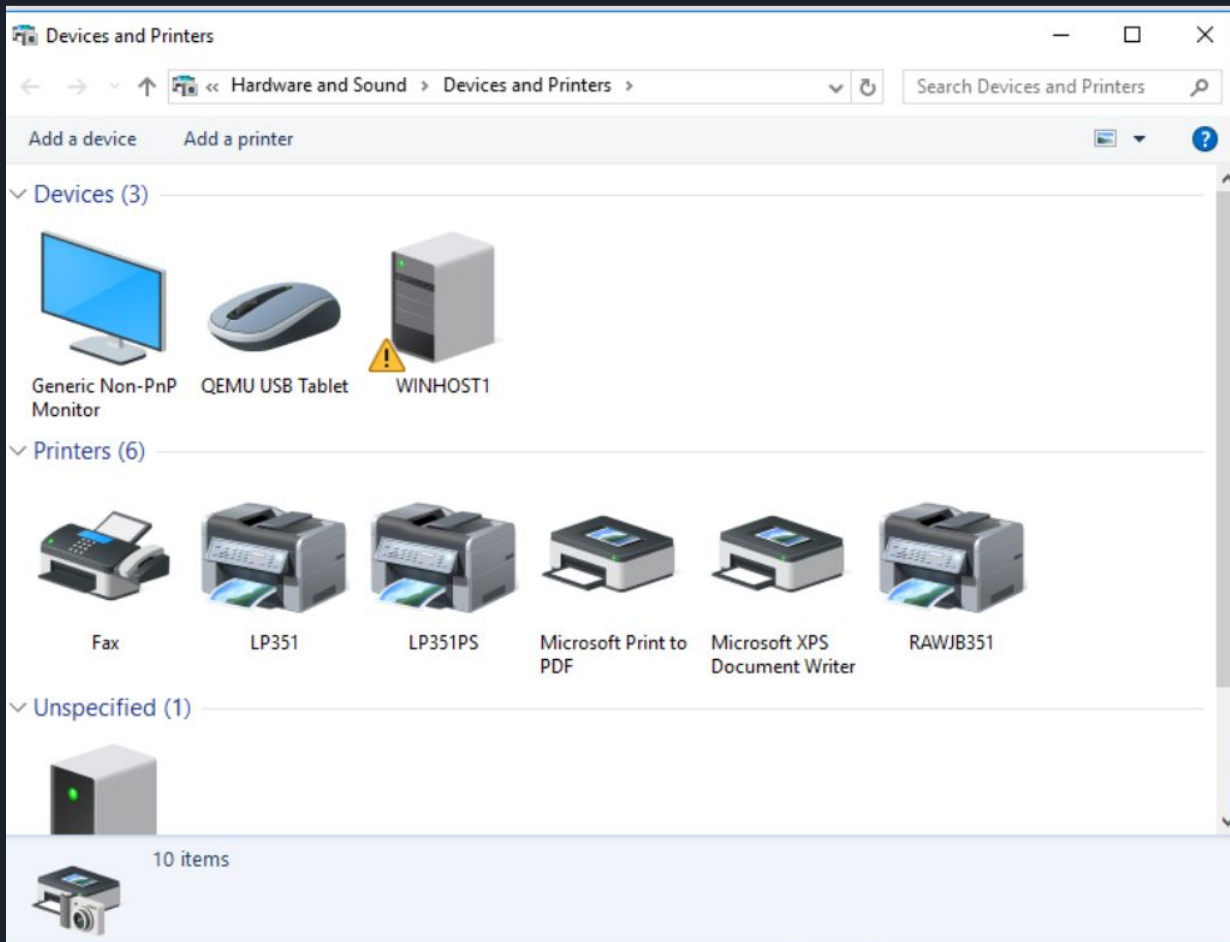

# Another example : a PDF generator which creates PDF documents
# in the user's home directory under the names JOB-iiii.pdf
# where iiii is the job id :
#
# Beware : using ~$TEAUSERNAME here doesn't work because the ~ is not expanded.
# NB : for this to work you might have to print with 'lp -o raw'
#
#prehook_rawpdf : /bin/cat $TEADATAFILE | su $TEAUSERNAME -s "ps2pdf - /usr/bin/getent passwd $TEAUSERNAME | /usr/bin/cut -f 6,6 -d ':'"
#prehook_rawpdf : /bin/cat $TEADATAFILE | /usr/bin/ps2pdf - /var/spool/cups-pdf/root/$TEAUSERNAME-$TEATITLE-$TEAPRINTERNAME-$TEACOPYNUMBER.pdf
prehook_rawpdf : /bin/cat $TEADATAFILE | /usr/bin/ps2pdf - /var/spool/cups-pdf/root/$TEAUSERNAME/$TEAPRINTERNAME/$TEAJOBID.pdf
```

Windows installation

- First to begin printing with windows operating system a designated Postscript driver should be installed and the specific printer must added to CUPS ip addressed.
